

## Liquid Masking - Natural Waste Disposal

Slime™ consists of 84 per cent water plus vinyl resin and alcohol. The film is quick and easy to apply with a spray gun, resists all solvents and paints as well as welding and abrasion wheel sparks and therefore protects a car during all repairs - from painting and drying to finishing.

Slime eliminates the need for time-consuming film or paper masking. This not only lowers costs and waste volume, but also ensures constant car mobility. As the film also traps dust and dirt, it protects the wet paint from contamination.

On completion of the repair, the protective film completely dissolves in water. Once any paint residues have been trapped in the particle separation facility, Slime's remaining organic substances are all biodegradable.

3M's proven Scotch™ tapes are ideal for masking edges and apertures in the car's interior.
